CONFERENCE

inter
airport
europe  **25TH**
EDITION

*Manuel Wehner • 25th Inter Airport Europe
Messe München, Munich • 10 October 2025*

A Deep Dive into Airport Robotics

- **AMR* development** for autonomous end-to-end airport cargo handling
- **Fleet monitoring and AMR control** through state-of-the-art software
- **Simulation and sensor tests** for specific and neuralgic airport traffic situations

* AMR = Autonomous Mobile Robot

Asking an AI software to design a ULD handling robot for airports...

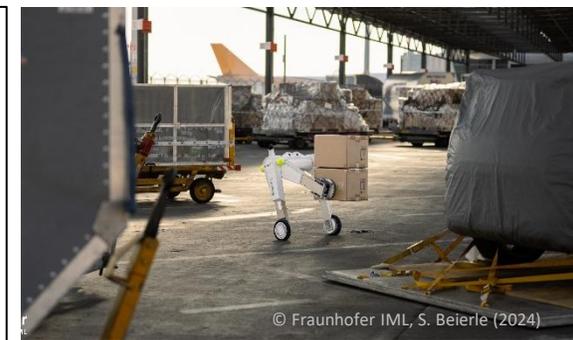

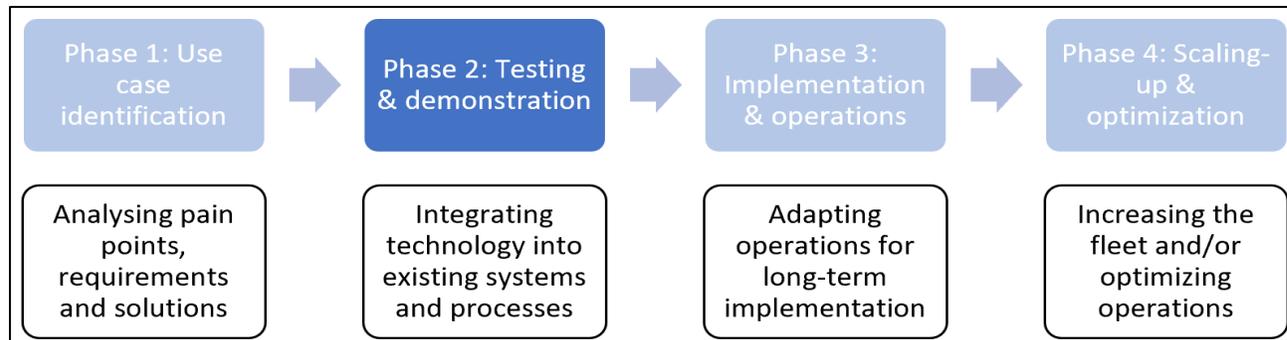

Generated with Fraunhofer Society's AI tools

Market overview

Autonomous cargo vehicles at airports worldwide

- Increasing number of applications (67 cases in 16 countries since 2017).
- Focus on tests and demonstrations, mostly transportation cases.
- Limited transfer of scientific knowledge from other industries so far.

Fraunhofer IML - R&D focus topics in aviation

Who we are:
Fraunhofer Society (Germany)

~ **32.000**
employees

IML's Focus Dept.

76 institutes (incl. IML)
and research centers

€ 3.4 bil.

annual research volume

We are Europe's largest **non-profit**
organization for applied research.

DTAC research focus (2021 – 2026)

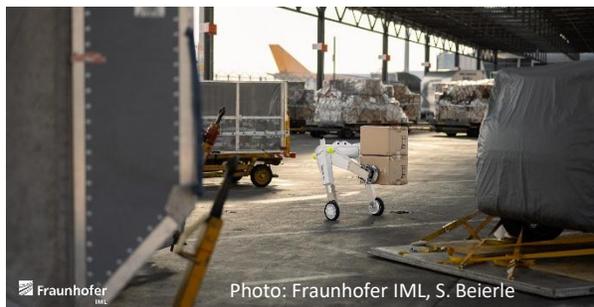

Focus today – our robotic tests in 2024:

? HOW can next-gen AMRs* support Air Cargo Handling?

* AMR: Autonomous Mobile Robot

Autonomous Warehouse Handling & Apron Transports

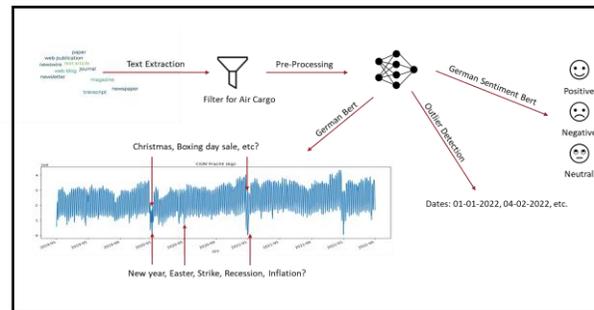

Our approach: R&D with own and market solutions

DTAC focus on AI:

? HOW can AI improve Air Cargo efficiency?

Predictive Analytics

Our approach: analyses based on historic cargo data

DTAC focus on data:

? Why is Data Sharing still so difficult ?

Data Platform & Digital Avatar

Never change a running system !

Why should I use ONE Record ?

- Free to use & Open Source
- Community driven
- Delivered as Source Code

Our approach: open-source server NE:ONE and IoT

Our 2024 multi-robot testbed for cargo flow automation

ULD: Unit load device (air cargo containers / build-up units, various sizes)

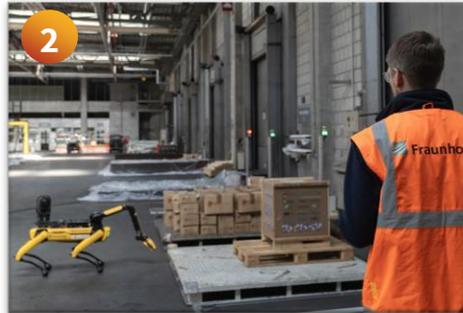

LSP: Large metal storage pallet (130 x 130 cm or 200 x 200 cm)

EPAL: Standardized wooden Euro-pallet (120 x 80 cm)

DTAC

»Digitales Testfeld Air Cargo«

2024 results - 2 airports, 5 robots, 12 test weeks, 674 tests

Auto-DollyTug® (Aurrigo)

Tests: n = 178
Success rate: 65 %
Autonomy level: 30 %

Spot® (Boston Dynamics & IML)

Tests: n = 77
Success rate: 95 %
Autonomy level: 60 %

LindeE20 (Götting KG)

Tests: n = 202
Success rate: 86 %
Autonomy level: 20 %

O³dyn (Fraunhofer IML)

Tests: n = 146
Success rate: 97 %
Autonomy level: 20 %

evoBOT® (Fraunhofer IML)

Tests: n = 71
Success rate: 89 %
Autonomy level: 0 %

- ✓ Outdoor functionality
- ✗ Load handling

- ✓ Autonomy level
- ✗ Assessing obstacles

- ✓ Repetit. storage tasks
- ✗ Unbalanced loads

- ✓ Pick-up from pallet
- ✗ Busy intersections

- ✓ Different shapes
- ✗ Automation outside lab

1st place: „Air Cargo Sustainability Award“

„Start-Up and Small Business“ category, The International Air Cargo Association (TIACA)

TIACA Exec. Summit 2025, Hongkong, 25 June 2025

Government Modernization

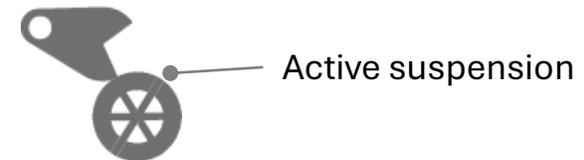

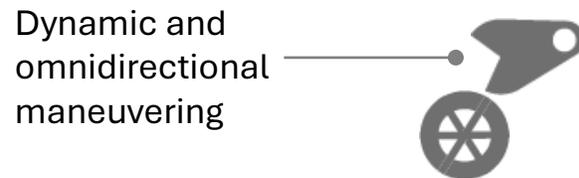

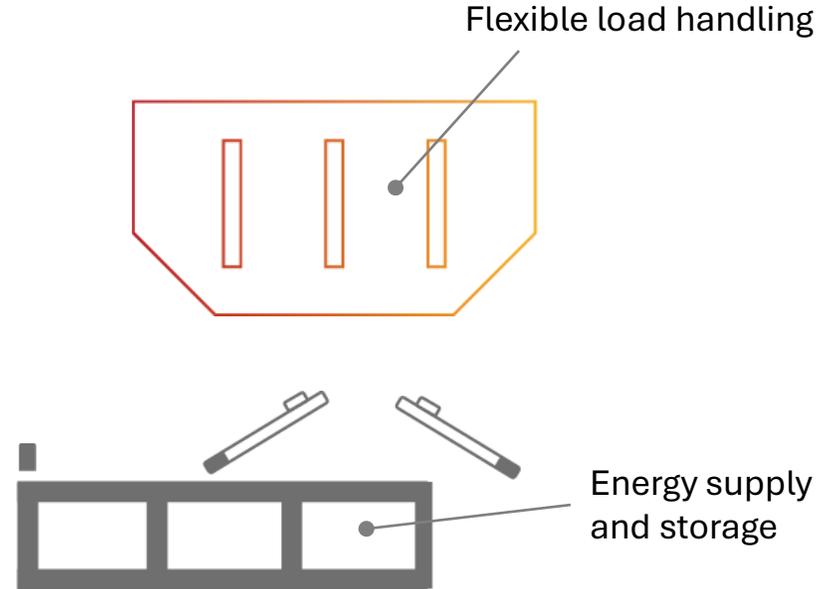

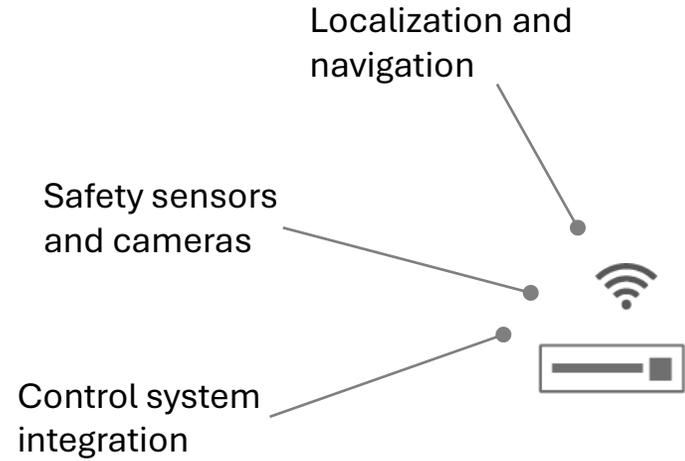

WP2 - Technology development (hardware and software)

Vehicle requirements (selection)

Vehicle requirements (selection)

8 operating modes for our new robot

#1 Docking

Reliable detection of highloader or docking stations

Docking at handover points indoor and outdoor (final approach)

#2 Cargo Indoor

Dynamic obstacle avoidance (free navigation)

Maneuvering indoor handover points

#3 Travel Indoor

Sensing and reacting to dynamic objects

Navigation in highly dynamic indoor/semi-indoor environment

#4 Aware Indoor

Sensing and reacting in aware areas

Gates passages, intersections, warning field, traffic priority passages

#5 Cargo Outdoor

Spatial and featureless environment

Maneuvering outdoor handover points

#6 Travel Outdoor

Sensing and reacting to dynamic objects

Navigation in highly dynamic outdoor environments

#7 Aware Outdoor

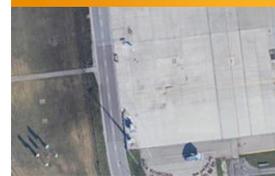

Sensing and reacting in aware areas

Pushbacks, intersections, uneven terrain, traffic priority passages, security checkpoints

#8 Freeway

Spatial and featureless environment

Outdoor routes with high velocity

#7 Aware Outdoor

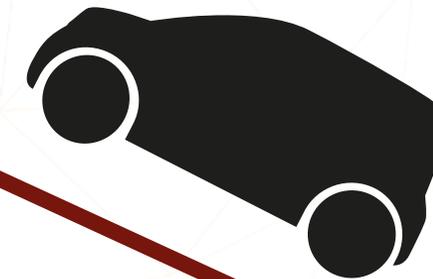

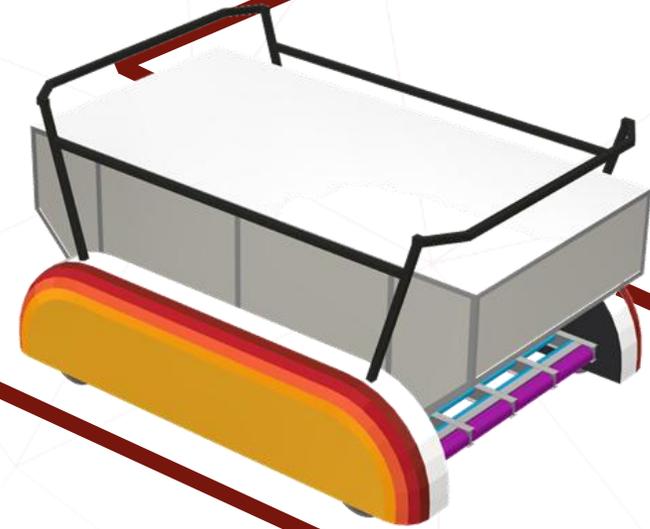

Outdoor area

Checkpoints, intersections

People, aircraft, vehicles

Vehicle kinematics

$v = 2 \text{ m/s} = 7,2 \text{ km/h}$

Centralizing monitoring and control:

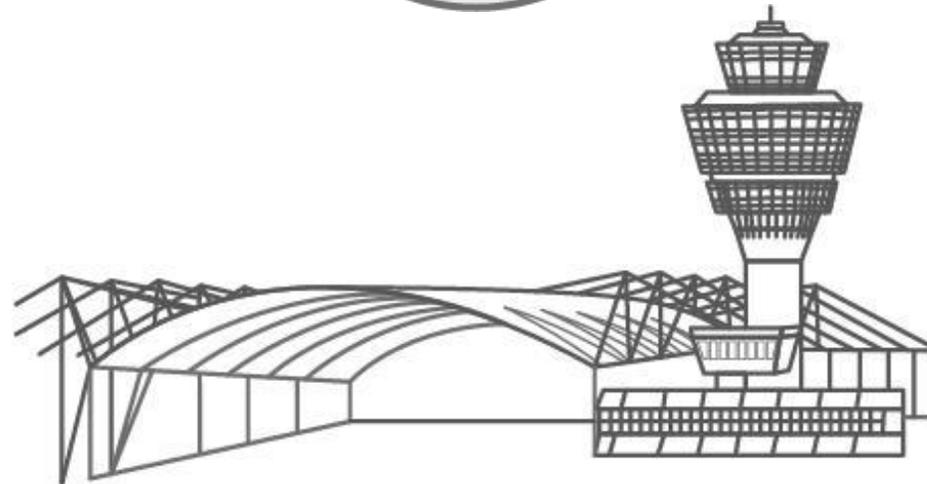

openTCS functions as the heart of the operations

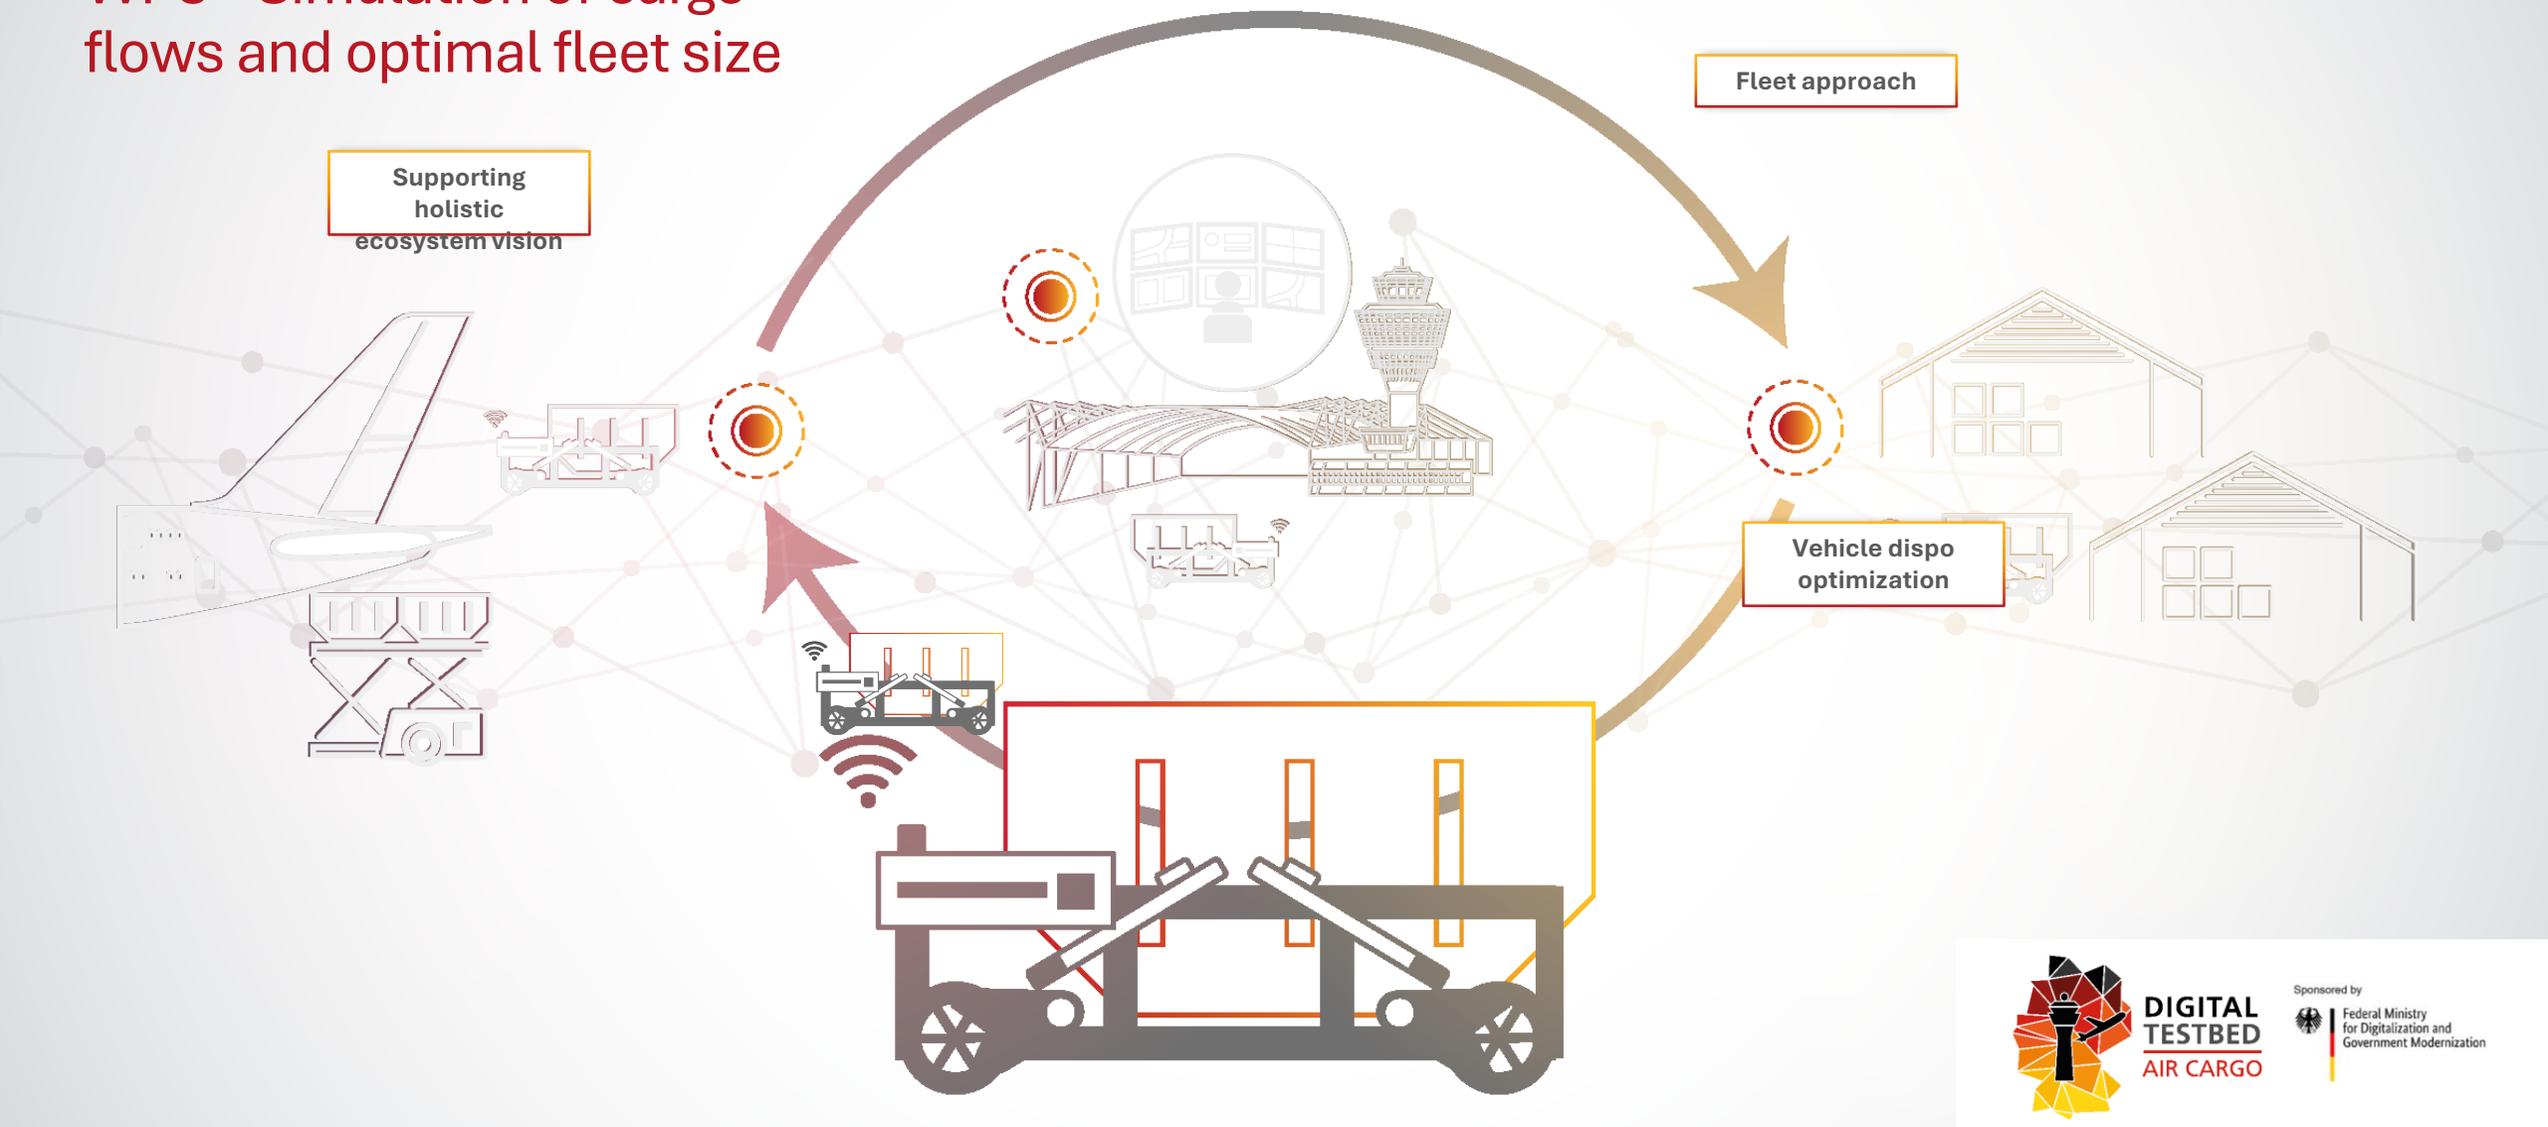

openTCS functions as the heart of the operations

- Open-source
- Manufacturer independent
- VDA5050 communication standard
- Airport specific control center for DTAC
- Web-based, mobile devices
- Integration with airport AI/Flightradar

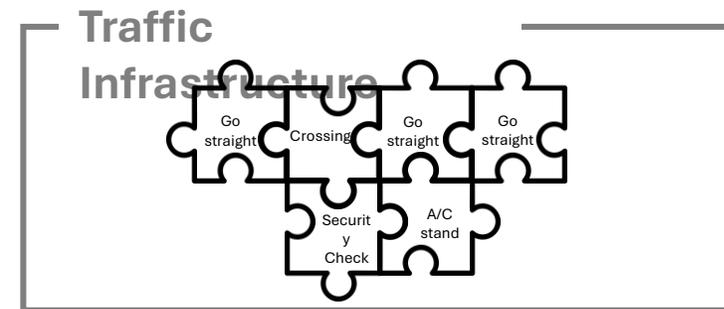

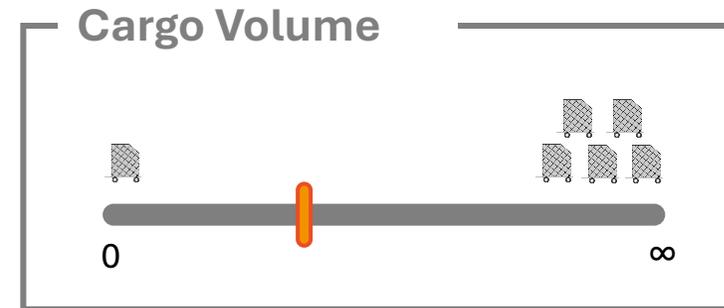

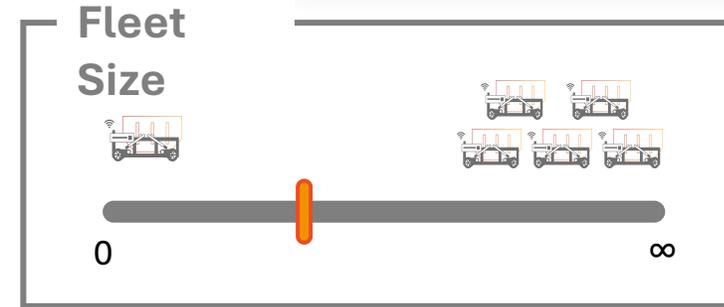

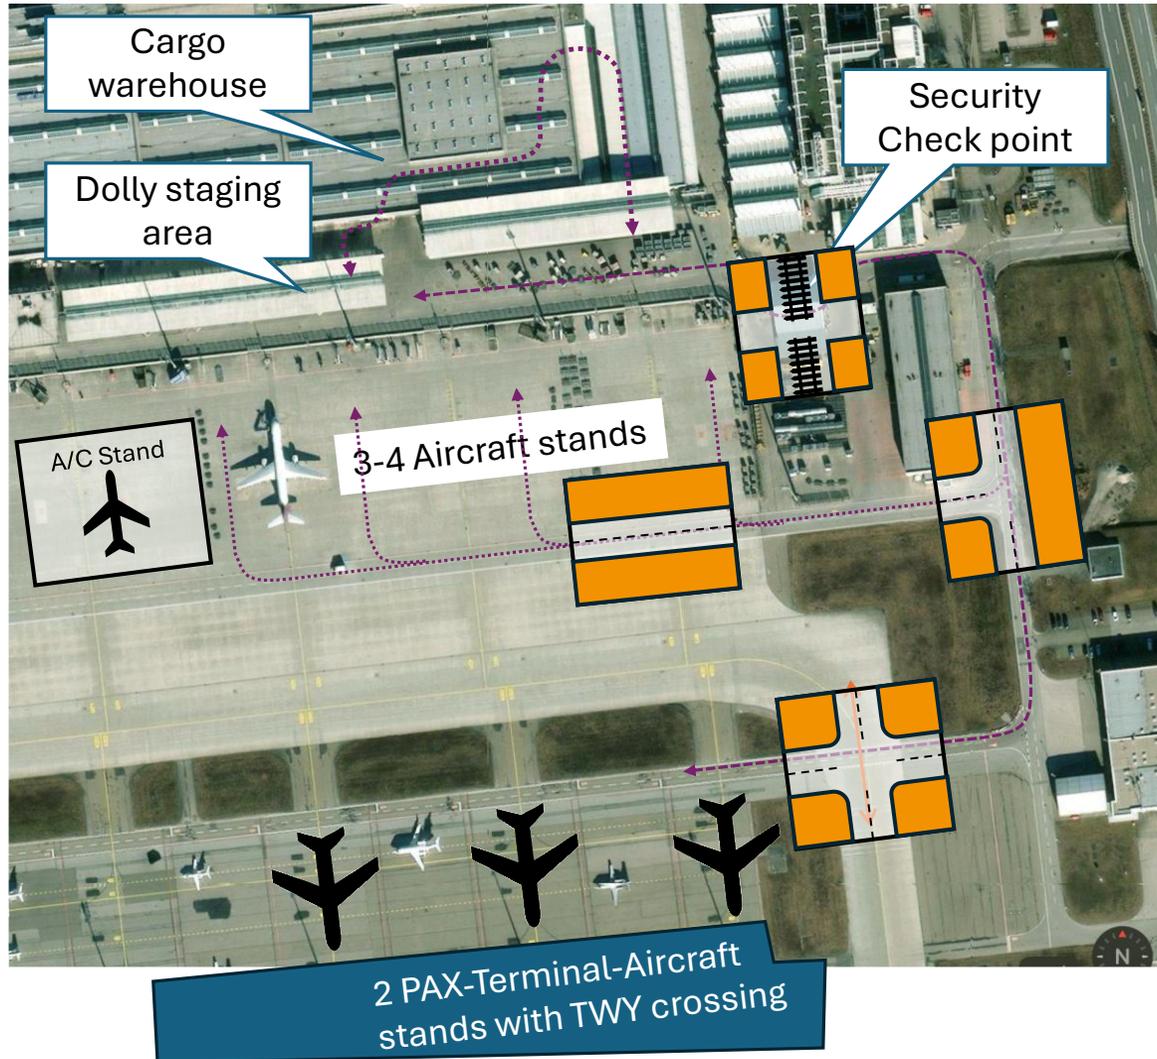

→ Control system software
for trials and implementations

WP3 - Simulation of cargo flows and optimal fleet size

Modular simulation concept - analysis of different fleet scenarios

“The control of airport surface traffic today can be described as manual.

(...) Many of the tasks [could] be done more easily, more reliably, and more efficiently with automation.

(...) A new [airport] surface surveillance and communication system must be developed to (...) provide surveillance and classification of surface vehicles.”

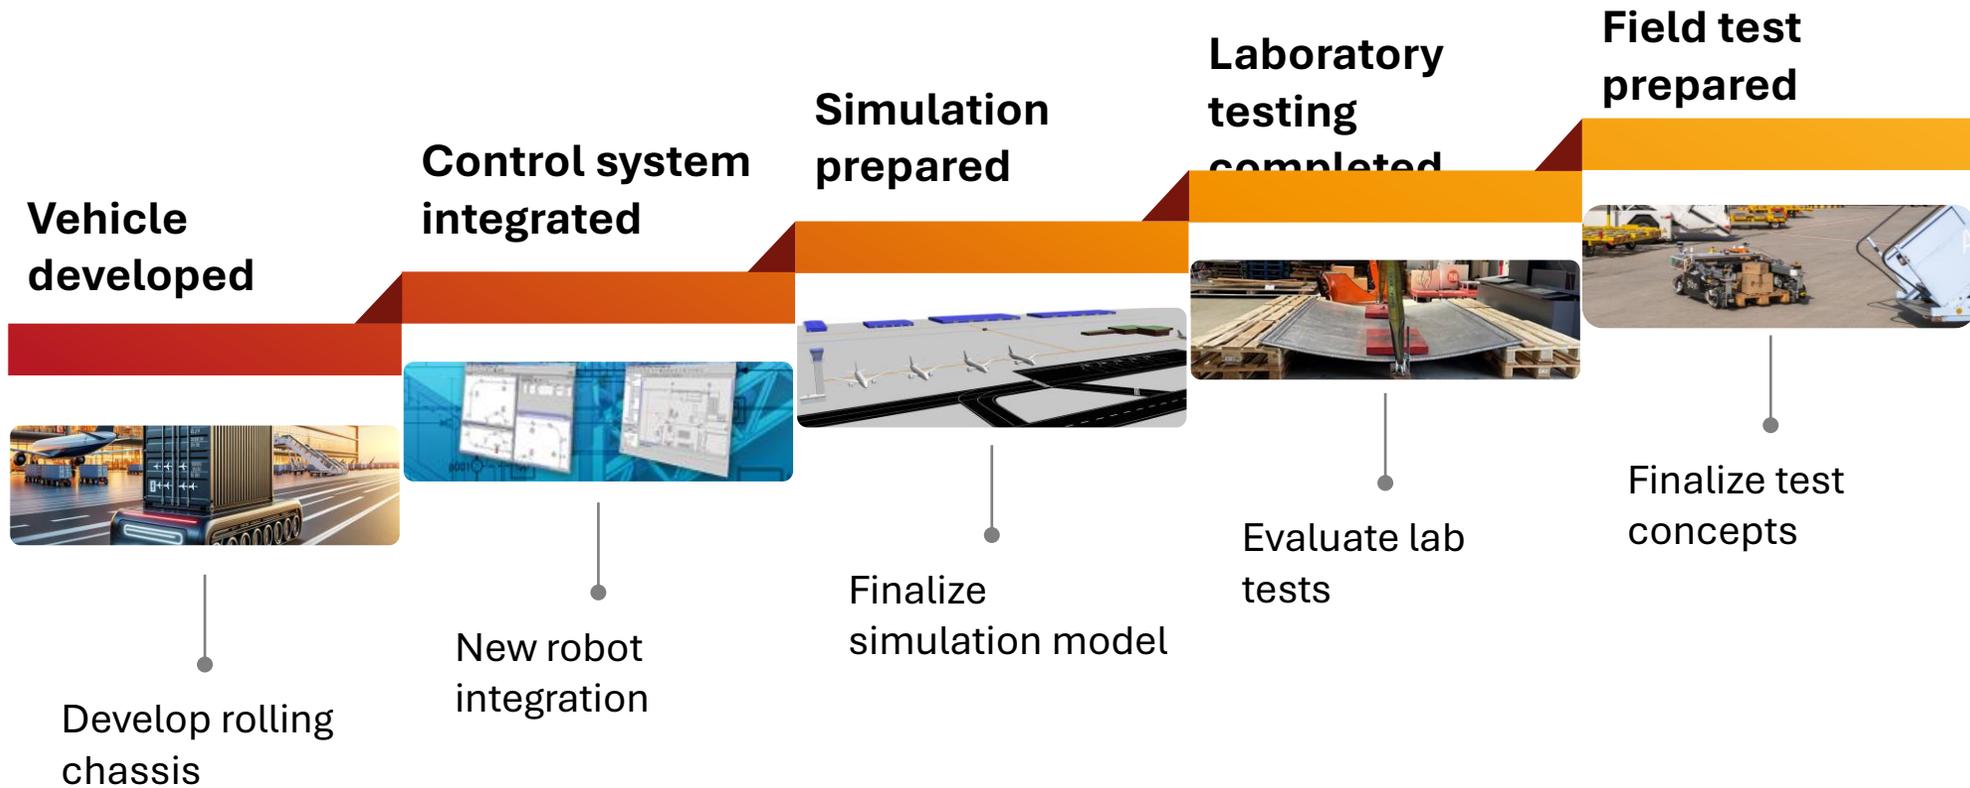

Hollister, W. M., “Airport Surface Traffic Automation Study”
 Massachusetts Inst. of Tech., Technical Report ADA194553, ATC-156, DOT/FAA/PS-87/1 ,1988.

Has the time finally come?

Photos: Fraunhofer IML, V. Neugebauer | M. Gössner | U. Ostermann | M. Wehner

Next steps – outlook until 08/2026

Target: new vehicle ready for airport tests from 09/2026

Thank you for your participation !
